My take (2):

A quantum processor that outperforms classical computers in computing  
... *a random number.*

# From quantum advantage to quantum practicality

Quantum advantage:

A programmable quantum device solves a problem that no classical computer can *feasibly* solve

John Preskill, arXiv:1203.5813, Arute et al, Nature 2019

Quantum practicality:

A programmable quantum device solves a *useful* problem that no classical computer can feasibly solve

*Quantum computers work in a completely different way from conventional computers. Volkswagen demonstrates the practical use of this technology for the first time with a pilot project for traffic optimization in Lisbon.*

# IBM Quantum Roadmap

For comparison:  
 1994 Shor's quantum algorithm for prime factorization  
 1999 First superconducting qubit demonstrated

# What stands in between quantum advantage and practicality?

Errors inevitably accumulate due to “decoherence”

*A massive* redundancy is required to correct those errors  
(suddenly millions of qubits are needed rather than a few thousand)

Extreme engineering effort

Breakthrough ideas (in hardware or software)

Simple problems: possibly 5 years

Breaking encryption: > 10 years

# Closing remark: From quantum code breaking to quantum key distribution and networks

The laws of quantum physics guarantee that

*no one can read, intercept, copy a quantum bit without getting noticed.*

New path to encryption, not based on hard mathematical problems but on laws of physics.
